I want to get the list of such files in the folder There are a few such files in the folder I want to get the list of such files in a list any suggestions on how can I get the list in Python 3? A: You can use StringIO() or io.open() with your file-path and check with your expected output i.e. yourfiles.txt. import stringIO from pathlib import Path path = Path(__file__) with path.open('r') as f: data = f.read().decode('ascii').encode('utf-8') print(data) getfiles = stringIO.StringIO(data) with path.open('r') as filepath: print(filepath.glob('*.txt')) Output Your files: enzaiova1sincensurasubespaol one.ttt Piece of code is taking above file path and then checking with your expected output, you need to change the path value according to your requirements. Q: How do I include batch statements with Oracle procedures? I'm working on a PL/SQL project which will have to deal with some SQLIte command (like deleting old rows from a table) and some batch processes (like executing multiple query). The SQL Statements I'll be using are: DELETE FROM.... DELETE FROM.... DELETE FROM.... The batch operation will be more complex, but consist of many statement like the ones shown above. I was thinking to encapsulate the batch statements in another stored procedure. Is this a good idea? How would I best do it? A: It is perfectly fine to put commands such as DELETE INTO or DELETE INTO in PL/SQL procedures. The Oracle documentation on Procedures states this quite clearly: 8.6.1 Using PL/SQL for control You can use PL/SQL as an alternative to SQL statements to control the execution of programs in the database. For example, you can start or stop a procedure. You can use PL/SQL as a separate unit of code that has the same privileges as any other PL/SQL unit. A procedure is encaps

Chinese web users are increasingly opting to spend their time browsing the browser of their choice, not the ubiquitous ones offered by well-known Western tech companies. China now has three big domestic browsers, and time spent on domestic web browsers has jumped 17.5 percent last year, according to data from Internet provider China Mobile and comparison shopping site Jianshe.com. China Mobile asked users of its 20 million premium access customers in May to use the user-defined interface, or UDF, to help it better understand how they use the Web. The UDF is accessible in web browsers such as Mozilla Firefox, Google Chrome and Opera. When a web browser encounters a website that includes a UDF, it prompts the user to choose from several customized web views that are adjusted to each user's needs. China Mobile found that 39.6 percent of the nationwide total time spent on domestic web browsers was on Internet Explorer, which was used by 29.8 percent of users. China Mobile said 60 percent of Firefox users were in urban China. Another 3.7 percent of users were on Apple's Safari browser, followed by 2.6 percent on Opera and 2.1 percent on China Mobile's own UDF browser. China Mobile did not disclose how many premium access users used the UDF. The current time spent on the UDF is about half of the monthly average for premium access users, according to the company. Jianshe.com's data covers the Internet population as a whole. Its report said that time spent on individual browsers increased about 7 percent from 2010, while that spent on Windows increased 30 percent. While Jianshe.com covered most Internet users, it did not include rural or less wealthy users, although it said that China was still divided into a relatively large number of Internet-using locations.Q: How to perform a simple
